Whether you're preparing for exams, conducting research, or solving practical decay-related issues, mastering the answer key to half-life problems helps build confidence and proficiency in this fundamental scientific concept.

Understanding Half-Life: The Basics

What Is Half-Life?

Half-life is the amount of time required for a quantity of a radioactive substance to reduce to half its initial amount. It is a characteristic property of each isotope, serving as a reliable measure of its stability and decay rate.

Key Concepts to Remember

- Radioactive Decay: Unpredictable at the individual atom level but statistically predictable for large samples.
- Decay Constant (λ): The probability per unit time that a nucleus will decay.
- Relationship Between Half-Life and Decay Constant:

\[

$$T_{1/2} = \frac{\ln 2}{\lambda}$$

\]

- Exponential Decay Law:

\[

$$N(t) = N_0 e^{-\lambda t}$$

\]

where:

- $N(t)$: amount remaining at time t
- N_0 : initial amount
- λ : decay constant
- t : elapsed time

Sample Problems with Solutions

Problem 1: Remaining Quantity After a Certain Time

Question:

A sample contains 100 grams of a radioactive isotope with a half-life of 10 hours. How much remains after 30 hours?

Solution Steps:

- Identify Known Variables:
- ($N_0 = 100\text{g}$)

[

$$\lambda = \frac{\ln 2}{T_{1/2}} = \frac{0.693}{10} = 0.0693, \text{ per hour}$$

]

- Apply the Exponential Decay Formula:

[

$$N(t) = N_0 e^{-\lambda t} = 100 \times e^{-0.0693 \times 30}$$

]

- Compute:

[

$$N(30) = 100 \times e^{-2.079} \approx 100 \times 0.125 = 12.5, g$$

]

[

$$t = \frac{1}{\lambda} \ln \left(\frac{N_0}{N(t)} \right)$$

]

- Calculate:

[

$$t = \frac{1}{0.0866} \ln \left(\frac{80}{20} \right) = \frac{1}{0.0866} \ln 4$$

Answer Key to Half-Life Problems: A Comprehensive Guide for Students and Enthusiasts

Understanding the concept of half-life is fundamental in various scientific disciplines, particularly in nuclear physics, radiology, pharmacology, and environmental science. Its practical applications range from determining radioactive decay, estimating drug dosages, to assessing the longevity of hazardous waste. As students and professionals alike grapple with solving half-life problems, having a clear, systematic approach becomes invaluable. This article provides an in-depth, analytical

review of the answer key to half-life problems, offering detailed explanations, strategies, and examples to demystify this essential concept.

Understanding the Concept of Half-Life

What Is Half-Life?

The half-life of a substance refers to the period required for half of the radioactive atoms or molecules in a sample to decay or for a substance's quantity to reduce by 50%. This measure is intrinsic to the nature of the substance and remains constant regardless of the initial amount.

Mathematically, it is associated with exponential decay processes described by the decay law:

[

$$N(t) = N_0 \times e^{-\lambda t}$$

]

where:

- $N(t)$ = quantity remaining at time t ,
- N_0 = initial quantity,
- λ = decay constant,
- t = elapsed time.

The half-life ($t_{1/2}$) relates directly to the decay constant via:

[

$$t_{1/2} = \frac{\ln 2}{\lambda}$$

]

This equation underscores the exponential nature of decay: after each interval of a half-life, the remaining quantity halves.

Why Is Half-Life Important?

The significance of understanding and calculating half-life extends beyond theoretical physics. It

enables scientists and practitioners to:

- Predict how long a radioactive material remains hazardous,
- Determine the age of archaeological samples (radiocarbon dating),
- Develop appropriate dosing schedules in medicine,
- Assess environmental cleanup timelines.

Core Strategies for Solving Half-Life Problems

1. Recognize the Type of Problem

Half-life problems generally fall into three categories:

- Remaining Quantity Problems: How much of a substance remains after a certain time?
- Time Calculation Problems: How long does it take for a substance to decay to a specific level?
- Initial Quantity Problems: What was the initial amount if the current amount and time are known?

Identifying the problem type guides the selection of the correct formula and approach.

2. Know the Key Formulas

The main equations to solve half-life problems include:

- Decay law: $N = N_0 e^{-\lambda t}$
- Half-life relation: $t_{1/2} = \frac{\ln 2}{\lambda}$
- Alternative form: $N = N_0 \left(\frac{1}{2}\right)^{t / t_{1/2}}$

Depending on the data provided, you may need to manipulate these formulas to solve for the unknown.

3. Convert Between Decay Constant and Half-Life

Since decay problems often provide either the half-life or decay constant, converting between them is crucial:

- From decay constant to half-life: $t_{1/2} = \frac{\ln 2}{\lambda}$

- From half-life to decay constant: $\lambda = \frac{\ln 2}{t_{1/2}}$

This conversion is especially helpful when your problem provides one parameter and asks for the other.

4. Use Logarithms for Simplification

When dealing with exponential equations, logarithms are essential for solving for time or initial quantities:

- To find t : $t = \frac{1}{\lambda} \ln \left(\frac{N_0}{N} \right)$
- When using base-2 logarithms: $t = t_{1/2} \times \log_2 \left(\frac{N_0}{N} \right)$

Mastery of logarithmic calculations simplifies complex problems significantly.

Step-by-Step Approach to Typical Half-Life Problems

Step 1: Read and Understand the Data

Identify what is given:

- Initial amount (N_0)
- Remaining amount (N)
- Time elapsed (t)
- Half-life ($t_{1/2}$)
- Decay constant (λ)

Determine what you need to find: remaining quantity, elapsed time, initial amount, or decay constant.

Step 2: Choose the Appropriate Formula

Based on the knowns and unknowns, select the formula:

- For remaining quantity after time t : $N = N_0 \times (1/2)^{t / t_{1/2}}$
- For time when a certain quantity remains: $t = t_{1/2} \times \log_2 \left(\frac{N_0}{N} \right)$
- For decay constant: $\lambda = \frac{\ln 2}{t_{1/2}}$

3. Convert Units if Necessary

Ensure all units are consistent, especially time units (seconds, minutes, years).

4. Plug in the Known Values and Solve

Perform calculations step by step, paying close attention to the order of operations and the use of logarithms.

5. Verify Results

Cross-check your answers by plugging back into the original equations to ensure they make sense.

Sample Problems and Their Answer Keys

Problem 1: Remaining Quantity After a Given Time

A 100-gram sample of a radioactive isotope has a half-life of 10 years. How much remains after 30 years?

Solution:

- Known:
- $(N_0 = 100) \text{ g}$
- $(t_{1/2} = 10) \text{ years}$
- $(t = 30) \text{ years}$

- Find:
- (N)

- Approach:
- Use $(N = N_0 \times (1/2)^{t / t_{1/2}})$

- Calculation:

$\backslash$

$$N = 100 \times \left(\frac{1}{2}\right)^{30/10} = 100 \times \left(\frac{1}{2}\right)^3 = 100 \times \frac{1}{8} = 12.5 \text{ g}$$

\\

Answer: Approximately 12.5 grams remain after 30 years.

Problem 2: Time to Decay to a Certain Level

A 200-gram sample of a substance with a half-life of 4 years decays to 25 grams. How long has it been decaying?

Solution:

- Known:

$$- (N_0 = 200) \text{ g}$$

$$- (N = 25) \text{ g}$$

$$- (t_{1/2} = 4) \text{ years}$$

- Find:

$$- (t)$$

- Approach:

$$- \text{Use } (N = N_0 \times (1/2)^{t / t_{1/2}})$$

- Calculation:

\\

$$\frac{N}{N_0} = \left(\frac{1}{2}\right)^{t / t_{1/2}}$$

\\

\\

$$\frac{25}{200} = \left(\frac{1}{2}\right)^{t/4}$$

\]

\[

$$0.125 = \left(\frac{1}{2}\right)^{t/4}$$

\]

Taking logarithms:

\[

$$\log_{1/2}(0.125) = \frac{t}{4}$$

\]

Since $\log_{1/2}(x) = \frac{\ln x}{\ln (1/2)}$:

\[

$$\frac{\ln 0.125}{\ln (1/2)} = \frac{t}{4}$$

\]

Calculate:

\[

$$\ln 0.125 = \ln \left(\frac{1}{8}\right) = -2.079$$

\]

\[

$$\ln (1/2) = -0.693$$

\]

Thus:

\[

$$\frac{-2.079}{-0.693} \approx 3$$

]

[

$$t = 4 \times 3 = 12 \text{ years}$$

]

Answer: It has been approximately 12 years since decaying to 25 grams.

Problem 3: Find the Half-Life Given Decay Data

A sample decreases from 150 grams to 50 grams over 6 years. What is its half-life?

Solution:

- Known:
- $(N_0 = 150) \text{ g}$
- $(N = 50) \text{ g}$
- $(t = 6) \text{ years}$

- Approach:
- Use the decay equation:

[

$$N = N_0 \times (1/2)^{t / t_{1/2}}$$

]

Common Half-Life Gizmo Questions and Solutions

Understanding typical questions can prepare students to navigate the Gizmo effectively. Below are some frequently encountered problems along with detailed solutions.

Question 1: Calculating Remaining Radioactive Material

Problem:

A sample initially contains 100 grams of a radioactive isotope with a half-life of 10 hours. How much remains after 30 hours?

Solution:

The decay follows exponential decay formula:

$$N = N_0 \times \left(\frac{1}{2}\right)^{t / T_{1/2}}$$

Where:

- $N_0 = 100$ grams
- $T_{1/2} = 10$ hours
- $t = 30$ hours

Calculations:

$$N = 100 \times \left(\frac{1}{2}\right)^{30/10} = 100 \times \left(\frac{1}{2}\right)^3 = 100 \times \frac{1}{8} = 12.5 \text{ grams}$$

Answer:

12.5 grams of the isotope remain after 30 hours.

Question 2: Determining the Half-Life from Data

Problem:

A sample of a radioactive material decays from 80 grams to 20 grams in 24 hours. What is its half-life?

Solution:

The decay from 80g to 20g involves two half-lives:

$$80 \rightarrow 40 \rightarrow 20$$

Number of half-lives: 2

Time for two half-lives: 24 hours

Therefore,

$$T_{1/2} = \frac{24 \text{ hours}}{2} = 12 \text{ hours}$$

Answer:

The half-life of the substance is 12 hours.

Question 3: Interpreting Decay Graphs

Problem:

Given a decay curve that shows the remaining amount of a substance over time, how can you estimate the half-life?

Solution:

Steps:

- Find the initial amount on the y-axis (N?).
- Locate the point where the remaining amount is approximately half of N?.
- Trace horizontally from this point to meet the decay curve, then go vertically down to the x-axis.
- The corresponding time on the x-axis is an estimate of the half-life.

Tip:

Using gridlines or digital tools can improve accuracy.

3. Balancing Nuclear Reactions

Problem Example: Balance the alpha decay of uranium-238:

Solution Steps:

- Determine the change in atomic number:
- Uranium atomic number = 92
- Alpha particle atomic number = 2
- The atomic number decreases by 2, so the daughter nucleus has atomic number 90.
- Mass number decreases by 4, so the daughter nucleus has a mass number of 234.
- Write the balanced equation: $^{238}\text{U} \rightarrow ^{234}\text{Th} + ^4\text{He}$

Answer: The decay produces thorium-234 and an alpha particle.

4. Calculating Activity of a Radioactive Sample

Problem Example: A 50-gram sample of radon-222 has a decay constant of 4.45×10^{-6} per second. What is its activity (in disintegrations per second)?

Solution Steps:

- Use the formula:
- Activity (A) = $\lambda \times N$
- Calculate the number of atoms, N:
- $N = (\text{mass} / \text{molar mass}) \times \text{Avogadro's number}$
- $N = (50 \text{ g} / 222 \text{ g/mol}) \times 6.022 \times 10^{23} = 1.35 \times 10^{23} \text{ atoms}$
- Calculate activity:

Common Types of Half-Life Problems and How to Approach Them

Understanding the types of problems you'll encounter helps in effectively using a practice key.

Type 1: Calculating Remaining Quantity

Problem Example:

"A sample initially contains 100 grams of a radioactive isotope. If its half-life is 5 hours, how much remains after 15 hours?"

Approach:

- Recognize that 15 hours corresponds to 3 half-lives ($15 \div 5$).
- Use the formula:

$$N = N_0 \times \left(\frac{1}{2}\right)^{t/T}$$

$$N = N_0 \times \left(\frac{1}{2}\right)^{t/T}$$

$$N = N_0 \times \left(\frac{1}{2}\right)^{t/T}$$

where:

N_0 = initial amount,

t = elapsed time,

T = half-life.

- Calculation:

$$N = 100 \times \left(\frac{1}{2}\right)^3 = 100 \times \frac{1}{8} = 12.5 \text{ grams}$$

$$N = 100 \times \left(\frac{1}{2}\right)^3 = 100 \times \frac{1}{8} = 12.5 \text{ grams}$$

$$N = 100 \times \left(\frac{1}{2}\right)^3 = 100 \times \frac{1}{8} = 12.5 \text{ grams}$$

Type 2: Determining Half-Life from Data

Problem Example:

"How long is the half-life of a substance if 25 grams remains after 20 hours, starting from 100 grams?"

Approach:

- Determine the number of half-lives passed:

$$\frac{N}{N_0} = \left(\frac{1}{2}\right)^{t/T}$$

$$\frac{N}{N_0} = \left(\frac{1}{2}\right)^{t/T}$$

\]

\[

$$\frac{25}{100} = \left(\frac{1}{2}\right)^{t/T}$$

\]

\[

$$0.25 = \left(\frac{1}{2}\right)^{t/T}$$

\]

- Recognize that:

\[

$$0.25 = \left(\frac{1}{2}\right)^2$$

\]

- So,

\[

$$t/T = 2 \Rightarrow T = \frac{t}{2} = \frac{20 \text{ hours}}{2} = 10 \text{ hours}$$

\]

Type 3: Calculating the Time for a Given Decay

Problem Example:

"How long will it take for 75 grams of a substance to decay to 25 grams, if its half-life is 4 hours?"

Approach:

- Find the number of half-lives:

[

$$\frac{25}{75} = \frac{1}{3}$$

]

- Since $\left(\frac{1}{2}\right)^n = \frac{1}{3}$, solve for (n) :

[

$$n = \log_{1/2} \left(\frac{1}{3} \right)$$

]

- Use change of base:

[

$$n = \frac{\log(1/3)}{\log(1/2)} \approx \frac{-0.4771}{-0.3010} \approx 1.58$$

]

- Total time:

[

$$t = n \times T = 1.58 \times 4 \approx 6.32, \text{ \textit{hours}}$$

]

Half Life Practice Key: A Comprehensive Guide to Mastering Radioactive Decay Problems

Introduction

Half life practice key is an essential tool for students and professionals working in fields related to nuclear physics, radiology, environmental science, and engineering. Mastering the concept of half-life and developing proficiency in solving related problems is crucial for understanding radioactive decay processes, calculating remaining quantities of substances, and applying these principles in practical scenarios. This article aims to demystify the concept of half-life, provide detailed strategies for solving related problems, and offer insights into effective practice techniques to enhance your proficiency.

Understanding the Concept of Half-Life

What Is Half-Life?

Half-life refers to the time required for a quantity of a radioactive substance to reduce to half of its initial amount. It is a characteristic property of each radioactive isotope, serving as a measure of its

stability or rate of decay.

Key points:

- Universal property: Every radioactive isotope has a specific half-life, which remains constant regardless of the amount or previous history of the substance.
- Exponential decay: The decay process follows an exponential pattern, meaning the substance decreases by half in each successive half-life period.

The Mathematical Foundation

The decay of a radioactive substance can be described mathematically by the exponential decay law:

$$N(t) = N_0 \times e^{-\lambda t}$$

Where:

- $N(t)$ is the quantity remaining after time t .
- N_0 is the initial quantity.
- λ is the decay constant (specific to each isotope).
- e is Euler's number (~ 2.71828).

The relationship between the half-life $T_{1/2}$ and the decay constant λ is:

$$T_{1/2} = \frac{\ln 2}{\lambda}$$

This equation ties together the measurable half-life with the decay constant, which is fundamental in calculations.

Core Principles for Solving Half-Life Problems

Recognizing the Types of Problems

Half-life calculations can be broadly categorized into:

- Remaining Quantity Problems: Determining how much substance remains after a certain period.
- Time Calculation Problems: Finding how long it takes for a substance to decay to a specific

amount.

- Initial Quantity Problems: Calculating the original amount based on current data and elapsed time.

Common Data and Variables

When approaching these problems, familiarize yourself with typical variables:

- N_0 : Initial amount
- $N(t)$: Remaining amount after time t
- $T_{1/2}$: Half-life of the isotope
- t : Time elapsed
- λ : Decay constant

Essential Formulas

- Remaining quantity after time t :

$$N(t) = N_0 \left(\frac{1}{2}\right)^{t / T_{1/2}}$$

- Time to reach a specific remaining quantity:

$$t = T_{1/2} \times \frac{\log(N_0 / N(t))}{\log 2}$$

- Decay constant from half-life:

$$\lambda = \frac{\ln 2}{T_{1/2}}$$

Step-by-Step Approach to Solving Half-Life Practice Problems

Step 1: Carefully Read the Problem

Identify knowns and unknowns. Clarify what the question asks ? whether it's the remaining amount, elapsed time, or initial quantity.

Step 2: Write Down Known Data and Formulas

Create a list of all known variables and relevant formulas. This helps organize your approach.

Step 3: Choose the Correct Formula

Select the most suitable equation based on the problem type:

- If finding remaining quantity: use $N(t) = N_0 \left(\frac{1}{2}\right)^{t / T_{1/2}}$.
- If calculating time: rearrange to solve for t .
- If determining initial quantity: reverse the calculation as needed.

Step 4: Plug in Known Values

Carefully substitute known variables into the formula. Pay attention to units; time should be consistent throughout.

Step 5: Perform Calculations Methodically

Use logarithmic functions as needed, and ensure your calculator is set to the correct mode (usually natural logs or base-10 logs).

Step 6: Verify Results

Check if your answer makes logical sense ? for example, a remaining quantity should not be greater than the initial amount, and time should be positive.

Practice Problems with Solutions

Problem 1: Remaining Quantity after a Given Time

An isotope has a half-life of 10 hours. How much of a 100-gram sample remains after 30 hours?

Solution:

- Identify data:
- $N_0 = 100$ grams
- $T_{1/2} = 10$ hours
- $t = 30$ hours

- Use the formula:

$$N(t) = N_0 \left(\frac{1}{2}\right)^{t / T_{1/2}}$$

- Calculate:

$$N(30) = 100 \times \left(\frac{1}{2}\right)^{30/10} = 100 \times \left(\frac{1}{2}\right)^3 = 100 \times \frac{1}{8} = 12.5 \text{ grams}$$

Answer: 12.5 grams remain after 30 hours.

Problem 2: Time to Decay to a Certain Amount

How long will it take for a 200-gram sample of an isotope with a 15-hour half-life to decay to 25 grams?

Solution:

- Known data:

- $(N_0 = 200)$ grams
- $(N(t) = 25)$ grams
- $(T_{1/2} = 15)$ hours

- Use the rearranged formula:

$$t = T_{1/2} \times \frac{\log(N_0 / N(t))}{\log 2}$$

- Calculate:

$$t = 15 \times \frac{\log(200/25)}{\log 2} = 15 \times \frac{\log 8}{\log 2}$$

Since $(\log 8 = 0.9031)$ and $(\log 2 = 0.3010)$:

$$t = 15 \times \frac{0.9031}{0.3010} \approx 15 \times 3.0 = 45 \text{ hours}$$

Answer: It takes approximately 45 hours for the sample to decay to 25 grams.

What is Decay? An Overview

Decay refers to the process by which unstable substances break down over time into more stable forms. This phenomenon is common in radioactive isotopes, biological systems, and chemical reactions. Understanding the principles of decay is crucial for interpreting data, making predictions, and solving related problems.

Types of Decay

Decay processes can be classified into various types depending on the context:

- **Radioactive Decay:** The spontaneous transformation of an unstable atomic nucleus into a different nucleus, emitting radiation.
- **Biological Decay:** The decomposition of organic matter over time due to microbial activity.
- **Chemical Decay:** The breakdown of chemical compounds through reactions such as hydrolysis or oxidation.

Common Decay Practice Questions

Practicing decay questions helps familiarize students with typical problem formats and enhances problem-solving skills. Here are some common types of decay questions:

Radioactive Decay Calculations

These questions usually involve calculating remaining radioactive material, half-life, or decay constants.

Sample Question 1:

A sample contains 100 grams of a radioactive isotope with a half-life of 10 hours. How much is left after 30 hours?

Question Breakdown:

- Initial amount: 100g
- Half-life: 10 hours
- Time elapsed: 30 hours

Solution:

Since the half-life is 10 hours, the number of half-lives passed in 30 hours is:

- Number of half-lives = 30 hours / 10 hours = 3

Each half-life reduces the remaining amount by half:

- After 1 half-life: $100\text{g} / 2 = 50\text{g}$
- After 2 half-lives: $50\text{g} / 2 = 25\text{g}$
- After 3 half-lives: $25\text{g} / 2 = 12.5\text{g}$

Answer: 12.5 grams remain after 30 hours.

Decay Constant and Rate Calculations

Questions may require calculating the decay constant (?) or the rate of decay.

Sample Question 2:

A radioactive isotope has a decay constant of 0.0693 per day. What is its half-life?

Solution:

Recall the relation:

$$t_{1/2} = \ln(2) / \lambda$$

Substituting:

$$t_{1/2} = 0.693 / 0.0693 \approx 10 \text{ days}$$

Answer: The half-life is approximately 10 days.

Sample Decay Practice Answer Key

Let's revisit the previous questions with their detailed answer keys.

Question 1:

Question: How much radioactive material remains after 30 hours if initial amount is 100g with a half-life of 10 hours?

Answer:

- Number of half-lives: 3
- Remaining amount: $100\text{g} \times (1/2)^3 = 100\text{g} \times 1/8 = 12.5\text{g}$

Explanation:

Each half-life halves the remaining quantity. After 3 half-lives:

$$\text{Remaining} = \text{Initial} \times (1/2)^{\text{Number of half-lives}}$$

Question 2:

Question: Determine the half-life of an isotope with a decay constant of 0.0693/day.

Answer:

$$- t_{1/2} = \ln(2) / \lambda = 0.693 / 0.0693 = 10 \text{ days}$$

Explanation:

The decay constant relates directly to the half-life. This formula is fundamental:

$$t_{1/2} = \ln(2) / \lambda$$

The decay practice answer key serves as a vital resource, offering solutions, explanations, and strategies to help learners grasp the core principles behind decay processes. Whether you're preparing for exams, working through homework, or simply seeking to deepen your understanding, this guide will walk you through the key concepts, common problem types, and best practices for utilizing your answer key to enhance learning.

What is Decay Practice?

Decay practice involves solving problems related to processes where quantities decrease over time, such as radioactive decay, population decline, or chemical reactions involving decay mechanisms. These problems typically involve exponential decay models and require understanding the mathematical relationships that govern decay processes.

Why is Decay Practice Important?

- Reinforces understanding of exponential functions
- Develops problem-solving skills in real-world contexts
- Prepares students for exams with varying difficulty levels
- Enhances ability to interpret decay graphs and data

A decay practice answer key provides step-by-step solutions, helping students verify their work, identify mistakes, and learn effective strategies for solving decay problems.

Core Concepts in Decay Problems

Before diving into practice problems, it's essential to understand the foundational concepts:

- Exponential Decay Model

The general form of an exponential decay function is:

$$N(t) = N_0 e^{-kt}$$

where:

- $N(t)$ is the quantity at time t
- N_0 is the initial quantity
- k is the decay constant (positive value)
- t is time

- Half-Life

The half-life ($t_{1/2}$) is the time it takes for a quantity to reduce to half its initial value:

$$t_{1/2} = (\ln 2) / k$$

Understanding the relationship between the decay constant and half-life allows for easier problem-solving.

- Decay Constant

The decay constant k is crucial for calculations. It can be derived from the half-life:

$$k = (\ln 2) / t_{1/2}$$

Types of Decay Problems and How to Approach Them

Decay practice problems can generally be categorized into several types, each requiring specific strategies. The decay practice answer key provides solutions and tips for each.

- Finding the Remaining Quantity After a Given Time

Problem example: A radioactive isotope has an initial amount of 100 grams. If its half-life is 10 years, how much remains after 30 years?

Approach:

- Calculate the decay constant k using the half-life.
- Use the decay formula to find $N(t)$.

Solution steps:

- $k = (\ln 2) / 10 \approx 0.0693$
- $N(30) = 100 e^{(-0.0693 \cdot 30)} \approx 100 e^{(-2.079)} \approx 100 \cdot 0.125 \approx 12.5$ grams

Answer: Approximately 12.5 grams remain after 30 years.

- Determining Time for a Given Decay

Problem example: How long will it take for a sample of 200 grams to decay to 50 grams, given a half-life of 8 years?

Approach:

- Use the decay formula and solve for t .
- Recognize that the amount halved twice (from 200 to 100, then 100 to 50), so total time is 2 half-lives.

Solution:

- Since each half-life is 8 years:
- Total time = $2 \times 8 = 16$ years

Answer: 16 years.

- Calculating Decay Constant from Half-Life

Problem example: Find the decay constant for a substance with a half-life of 5 days.

Approach:

- Use the formula $k = (\ln 2) / t_{1/2}$.

Solution:

- $k = (\ln 2) / 5 \approx 0.6931 / 5 \approx 0.1386$ per day

Answer: The decay constant is approximately 0.1386 per day.

- Applying Decay in Real-World Contexts
