Sample DU A Unit Chemistry Question and Its Step-by-Step Solution

Question:

Calculate the number of moles in 22.4 liters of a gas at standard temperature and pressure (STP).

Step 1: Understand the problem

The question asks for the number of moles, given a volume at STP. This is a classic molar volume problem.

Step 2: Recall relevant concept

At STP (Standard Temperature: 0°C or 273.15 K, and Pressure: 1 atm), one mole of any ideal gas occupies 22.4 liters.

Step 3: Apply the molar volume fact

Using the molar volume:

$$- 1 \text{ mole of gas} = 22.4 \text{ liters at STP}$$

Step 4: Set up the proportion

Number of moles = Volume of gas / Molar volume

$$\text{Number of moles} = 22.4 \text{ liters} / 22.4 \text{ liters} = 1 \text{ mole}$$

Answer:

There is 1 mole of gas in 22.4 liters at STP.

Common Challenges and How to Overcome Them

Misinterpretation of Questions

Always read questions multiple times. Highlight key data points and what the question specifically asks.

Incorrect Application of Formulas

Ensure you understand the derivation and conditions under which formulas are valid. For example, ideal gas law assumptions may not hold for real gases at high pressure.

In this detailed review, we will dissect a typical DU unit chemistry question, providing a comprehensive explanation of each step, underlying concepts, and common pitfalls. This guide aims to enhance your problem-solving skills, deepen your

conceptual understanding, and prepare you for similar questions in your exams.

Introduction to DU Chemistry Unit Questions

DU's chemistry syllabus is designed to test both theoretical knowledge and practical application skills. The questions often combine multiple concepts such as atomic structure, chemical bonding, thermodynamics, equilibrium, kinetics, and periodic properties.

Key features of DU unit questions include:

- Multiple-step problems requiring logical reasoning.
- Application of mathematical formulas with precise calculations.
- Emphasis on conceptual clarity rather than rote memorization.
- Integration of various topics into a single problem.

Example Question Overview

Let's consider a representative DU unit chemistry question that involves concepts of chemical equilibrium, thermodynamics, and molar calculations:

A 0.5 mol sample of a gas is contained in a 10 L vessel at an initial temperature of 300 K. The gas undergoes a reaction:

with an equilibrium constant ($K_c = 2.0$) at this temperature. Calculate:

- The equilibrium concentrations of A and B.
- The change in Gibbs free energy (ΔG°) for the reaction at 300 K.
- The amount of B formed at equilibrium.

Step-by-Step Breakdown of the Solution

Understanding the Question and Gathering Data

Given Data:

- Initial moles of A, $(n_{A_initial} = 0.5, \text{mol})$
- Volume of the container, $(V = 10, \text{L})$
- Temperature, $(T = 300, \text{K})$
- Equilibrium constant, $(K_c = 2.0)$

Goals:

- Find equilibrium concentrations of A and B.
- Calculate (ΔG°) .
- Determine the moles of B formed at equilibrium.

Fundamental Concepts and Formulas Involved

- Concentrations from Moles and Volume:

[

$$[\text{A}] = \frac{n_A}{V}$$

]

[

$$[\text{B}] = \frac{n_B}{V}$$

]

- Equilibrium Constant Expression:

For the reaction:

[

]

[

$$K_c = \frac{[\text{B}]_{\text{eq}}}{[\text{A}]_{\text{eq}}}$$

\]

- ICE Table (Initial, Change, Equilibrium):

Set up for the reaction:

\[

\]

	Initial (mol)	Change (mol)	Equilibrium (mol)
A	0.5	-x	0.5 - x
B	0	+x	x

|-----|-----|-----|-----|

| A | 0.5 | \(-x\) | \((0.5 - x)\) |

| B | 0 | \((+x)\) | \((x)\) |

Note: Since initial B is zero, and x is the moles of B formed at equilibrium.

Calculating Equilibrium Concentrations

Step 1: Convert initial moles to molar concentrations

\[

$$[\text{A}]_{\text{initial}} = \frac{0.5 \text{ mol}}{10 \text{ L}} = 0.05 \text{ M}$$

\]

Since initially, $[\text{B}] = 0$.

Step 2: Write equilibrium concentrations

\[

$$[\text{A}]_{\text{eq}} = 0.05 - \frac{x}{10} = 0.05 - 0.1x$$

\\

\\

$$[\text{B}]_{\text{eq}} = \frac{x}{10} = 0.1x$$

\\

Step 3: Use (K_c) to find (x)

\\

$$K_c = 2.0 = \frac{[\text{B}]_{\text{eq}}}{[\text{A}]_{\text{eq}}} = \frac{0.1x}{0.05 - 0.1x}$$

\\

Step 4: Solve for (x)

\\

$$2.0 (0.05 - 0.1x) = 0.1x$$

\\

\\

$$0.1 - 0.2x = 0.1x$$

\\

\\

$$0.1 = 0.3x$$

\\

\\

$$x = \frac{0.1}{0.3} = \frac{1}{3} \approx 0.333, \text{ mol}$$

\]

Step 5: Find equilibrium concentrations

\[

$$[\text{A}]_{\text{eq}} = 0.05 - 0.1 \times 0.333 \approx 0.05 - 0.0333 = 0.0167, \text{M}$$

\]

\[

$$[\text{B}]_{\text{eq}} = 0.1 \times 0.333 \approx 0.0333, \text{M}$$

\]

Calculating the Change in Gibbs Free Energy (ΔG°)

Formula:

\[

$$\Delta G^\circ = -RT \ln K_c$$

\]

where:

$$- (R = 8.314, \text{J mol}^{-1} \text{K}^{-1})$$

$$- (T = 300, \text{K})$$

$$- (K_c = 2.0)$$

Calculation:

\[

$$\Delta G^\circ = - (8.314)(300) \ln 2.0$$

\]

$$\ln 2.0 \approx 0.693$$
$$\Delta G^\circ \approx - (8.314)(300)(0.693) \approx - (8.314 \times 300 \times 0.693)$$

Compute step-by-step:

$$8.314 \times 300 = 2494.2$$
$$2494.2 \times 0.693 \approx 1727.3, \text{ J/mol}$$

Result:

$$\boxed{\Delta G^\circ \approx -1727, \text{ J/mol}}$$

The negative sign indicates the reaction is spontaneous under standard conditions.

Determining the Moles of B at Equilibrium

From earlier calculations:

$$n_{\text{B, eq}} = [\text{B}]_{\text{eq}} \times V = 0.0333 \text{ M} \times 10 \text{ L} = 0.333 \text{ mol}$$

\\

Summary:

- Equilibrium concentration of A: approximately 0.0167 M
- Equilibrium concentration of B: approximately 0.0333 M
- Moles of B formed at equilibrium: approximately 0.333 mol
- ΔG° : approximately -1727 J/mol

Conceptual Deep Dive

Understanding the Underlying Principles

- The Relationship Between K_c and Spontaneity:
 - A $K_c > 1$ suggests the reaction favors products at equilibrium.
 - The negative ΔG° confirms the reaction's spontaneity under standard conditions.
 - The magnitude of ΔG° indicates the extent of spontaneity.
- The Significance of Concentrations and Moles:
 - Converting between moles and molarity is crucial for applying equilibrium expressions.
 - The initial amount of reactant determines the maximum possible amount of product formed.
- The ICE Table Approach:
 - A systematic method to handle initial data, changes, and equilibrium states.
 - Helps visualize the problem and reduces errors.
- Thermodynamic Calculations:

- The formula $\Delta G^\circ = -RT \ln K_c$ links equilibrium to thermodynamics.
- Understanding the sign and magnitude of ΔG° provides insights into reaction feasibility.

Common Pitfalls and How to Avoid Them

- Ignoring units: Always convert moles to molarity when applying equilibrium expressions.
- Mishandling signs: Pay attention to the change in moles (x) and ensure correct algebraic signs.
- Calculation errors: Use calculator carefully, especially while computing logs and products.
- Misinterpretation of ΔG° : Remember that a negative ΔG° indicates spontaneity under standard conditions.

Additional Insights and Advanced Concepts

Effect of Temperature on Equilibrium and ΔG°

- The value of K_c depends on

QuestionAnswer How do I solve a DU A Unit Chemistry question involving molarity? To solve a molarity question, first identify the moles of solute and the volume of solution in liters. Then, use the formula $M = \text{moles of solute} / \text{liters of solution}$ to find the molarity. Rearrange the formula as needed to solve for the unknown. What is the common method to balance chemical equations in DU A Unit Chemistry questions? The common method is to balance the atoms of each element on both sides of the equation by adjusting coefficients, ensuring the total atoms of each element are equal on both sides. Start with complex molecules and balance elements appearing in the fewest compounds first. How can I determine the empirical formula from a DU A chemistry problem? To determine the empirical formula, convert the percentage composition to grams, then calculate moles of each element. Divide all mole values by the smallest number of moles to get the simplest whole-number ratio, which is the empirical formula. What approach should I take to solve gas law problems in DU A chemistry questions? Identify the given quantities (pressure, volume, temperature, moles) and use the appropriate gas law equation ($PV=nRT$, Boyle's law, Charles's law, etc.). Rearrange to solve for the unknown variable, ensuring units are consistent. How do I calculate pH from a given concentration in DU A Unit Chemistry? Use the formula $\text{pH} = -\log[\text{H}^+]$, where $[\text{H}^+]$ is the concentration of hydrogen ions. If dealing with a strong acid, assume complete dissociation. For weak acids, use the acid dissociation constant (K_a) to find $[\text{H}^+]$. What steps are involved in solving titration problems in DU A chemistry questions? Identify the known volume and concentration of the titrant or analyte. Use the titration formula ($M_1V_1 = M_2V_2$) to find the unknown concentration or volume. Pay attention to units and equivalence points. How do I determine the limiting reagent in a DU A Chemistry question? Calculate the moles of each reactant from their given masses and molar

ratios. The reactant with the fewer moles reacting completely is the limiting reagent, which limits the amount of product formed. What is the best way to approach solved examples of atomic structure in DU A Unit Chemistry? Understand the concepts behind atomic models, quantum numbers, and electron configurations. Study solved examples step-by-step to see how to determine electron arrangements, atomic number, and mass number, building foundational understanding.

Atoms are considered the basic building blocks of matter and are indivisible in chemical reactions. Modern physics has shown atoms can be divided into subatomic particles, but in the context of basic chemistry and NCERT syllabus, atoms are regarded as indivisible units.

Exercise 3.2: Numerical Problems

Question 1:

Calculate the number of molecules in 18 grams of water (H_2O). (Atomic masses: H = 1, O = 16)

Solution:

Step 1: Calculate molar mass of water.

$$\text{Molar mass of } H_2O = (2 \times 1) + 16 = 18 \text{ g/mol}$$

Step 2: Determine moles of water.

$$\text{Number of moles} = \text{mass} / \text{molar mass} = 18 \text{ g} / 18 \text{ g/mol} = 1 \text{ mol}$$

Step 3: Use Avogadro's number to find molecules.

$$\text{Number of molecules} = \text{number of moles} \times \text{Avogadro's number}$$

$$= 1 \text{ mol} \times 6.022 \times 10^{23} \text{ molecules/mol}$$

$$= 6.022 \times 10^{23} \text{ molecules}$$

Answer:

There are approximately 6.022×10^{23} molecules in 18 grams of water.

Exercise 3.3: Conceptual Questions

Question 1:

Explain the difference between an atom and a molecule.

Solution:

An atom is the smallest unit of an element that retains the chemical properties of that element. It consists of protons, neutrons, and electrons.

A molecule is formed when two or more atoms chemically combine. Molecules can consist of atoms of the same element (e.g., O_2) or different elements (e.g., H_2O).

Key Differences:

- Atoms are single units; molecules are groups of atoms bonded together.
- Molecules can be composed of multiple atoms; atoms are the fundamental units of elements.
- Molecules can be diatomic or polyatomic, whereas atoms are singular units.

Exercise 3.4: Short Answer Questions

Question 1:

Derive the empirical formula of a compound that contains 40% carbon and 60% oxygen by mass.

Solution:

Step 1: Assume 100 g of the compound.

- Carbon: 40 g

- Oxygen: 60 g

Step 2: Convert masses to moles.

- Moles of carbon = $40 \text{ g} / 12 \text{ g/mol} = 3.33 \text{ mol}$
- Moles of oxygen = $60 \text{ g} / 16 \text{ g/mol} = 3.75 \text{ mol}$

Step 3: Find the simplest ratio.

Divide both by the smaller number (3.33):

- Carbon: $3.33 / 3.33 = 1$
- Oxygen: $3.75 / 3.33 \approx 1.13$

Step 4: Approximate to whole numbers.

Since $1.13 \approx 1.13$, multiply both by 7 to get whole numbers:

- Carbon: $1 \times 7 = 7$
- Oxygen: $1.13 \times 7 \approx 8$

Final ratio: C₇O₈

Empirical formula: C₇O₈

QuestionAnswer What is the primary difference between ionic and covalent bonding in inorganic

chemistry? Ionic bonding involves the transfer of electrons between atoms, resulting in positively and negatively charged ions held together by electrostatic forces, while covalent bonding involves sharing of electron pairs between atoms to achieve a stable electronic configuration. How do you determine the oxidation state of an element in an inorganic compound? To determine the oxidation state, assign known oxidation numbers based on the element's typical charges, consider the overall charge of the compound or ion, and use algebraic methods to solve for unknown oxidation states within the molecule. Solve for the empirical formula of a compound that contains 40% sulfur and 60% oxygen by mass. Assuming 100 g of the compound: sulfur = 40 g, oxygen = 60 g. Convert to moles: $S = 40/32.06 = 1.247$ mol; $O = 60/16.00 = 3.75$ mol. Divide by the smallest number: $S = 1.247/1.247 = 1$; $O = 3.75/1.247 = 3.01 \approx 3$. Empirical formula: SO_3 . Calculate the molar mass of potassium permanganate ($KMnO_4$). The molar mass is calculated as: $K (39.10) + Mn (54.94) + 4 \times O (4 \times 16.00) = 39.10 + 54.94 + 64.00 = 158.04$ g/mol. Determine the coordination number and geometry of a complex ion $[Co(NH_3)_6]^{3+}$. The complex has six ligands (NH_3 molecules) attached to the cobalt ion, giving a coordination number of 6. The geometry is octahedral. What is the principle behind the Born-Haber cycle in calculating lattice enthalpy? The Born-Haber cycle uses Hess's law to relate the lattice enthalpy of an ionic solid to ionization energies, electron affinities, sublimation energy, and the dissociation energy of molecules, allowing the calculation of lattice energy from experimentally known values. Solve for the concentration of a solution if 10 mL of 0.5 M H_2SO_4 is diluted to 250 mL. Using $C_1V_1 = C_2V_2$: $(0.5 \text{ M})(10 \text{ mL}) = C_2(250 \text{ mL})$. Hence, $C_2 = (0.5 \times 10) / 250 = 5 / 250 = 0.02 \text{ M}$. Explain the concept of ligand field theory in inorganic chemistry. Ligand field theory explains the bonding and properties of coordination compounds by considering the interaction between metal d-orbitals and ligand electron pairs, leading to splitting of d-orbitals and influencing magnetic and spectral properties. Calculate the pH of a 0.01 M HCl solution. Since HCl is a strong acid, it dissociates completely: $[H^+] = 0.01 \text{ M}$. Therefore, $pH = -\log[H^+] = -\log(0.01) = 2$. What is the purpose of a spectrochemical series in inorganic chemistry? The spectrochemical series ranks ligands based on their ability to split the d-orbital energies in a metal complex, affecting the color and electronic properties of the complex.
