- A) Hexagonal close-packed (HCP)
- B) Face-centered cubic (FCC)
- C) Body-centered cubic (BCC)
- D) Tetragonal

Answer: B) Face-centered cubic (FCC)

Explanation:

Metals commonly crystallize in various structures, but the face-centered cubic (FCC) structure is prevalent among many metals like aluminum, copper, and gold due to its high packing efficiency (~74%). The FCC structure allows for close packing of atoms, which contributes to metallic properties such as ductility and electrical conductivity.

Question 2:

In a semiconductor, the energy gap between the valence band and conduction band is typically:

- A) Less than 0.1 eV
- B) Between 0.1 eV and 3 eV
- C) More than 3 eV
- D) Zero

Answer: B) Between 0.1 eV and 3 eV

Explanation:

Semiconductors have an energy band gap generally in the range of 0.1 eV to 3 eV. Materials like

silicon (~ 1.1 eV) and germanium (~ 0.66 eV) fall within this range. This band gap allows semiconductors to conduct electricity under certain conditions, making them essential in electronic devices.

Question 3:

Which statement about conductors is correct?

- A) They have a completely filled valence band and an empty conduction band.
- B) They have overlapping valence and conduction bands.
- C) They have a large band gap between valence and conduction bands.

Answer: B) They have overlapping valence and conduction bands.

Explanation:

In conductors like metals, the valence band overlaps with the conduction band, or the bands are partially filled, allowing free movement of electrons. This overlapping facilitates high electrical conductivity. In insulators and semiconductors, the bands are separated by a significant energy gap.

Question 4:

Which of the following is a point defect commonly found in crystals?

- A) Metals and nonmetals
- B) Conductors and insulators
- C) Semiconductors and insulators
- D) All of the above

Answer: D) All of the above

Explanation:

Band gap is a crucial parameter in solid state physics that helps classify materials. Metals have overlapping bands or no band gap, insulators have a large band gap, and semiconductors have a moderate band gap. Therefore, the concept applies across these categories to understand electrical behavior.
