4. How does the PowerCenter handle data flow?

PowerCenter handles data flow through mappings, which define the flow of data from sources to targets via transformations. These mappings are executed through sessions and workflows, enabling scheduled or real-time data processing.

5. What is a workflow in Informatica?

A workflow is a set of instructions that define how and when to execute tasks like sessions, commands, or email notifications. It orchestrates the complete data processing process.

6. Describe the concept of session in Informatica.

A session is a configuration object that executes a mapping. It specifies source and target connections, transformation logic, and other properties needed for data movement.

7. What is the difference between a maplet and a mapping?

- **Mapping:** Defines the entire data flow from source to target.
- **Maplet:** A reusable set of transformations that can be embedded within multiple mappings.

8. How do you handle data errors in Informatica?

Data errors can be managed through error handling options in transformations, reject files, or by configuring error logs. Also, the 'Error' and 'Reject' ports help capture problematic data for review and correction.
