- Use the lens formula $\frac{1}{f} = \frac{1}{v} + \frac{1}{u}$.

Precautions:

- Ensure the object and screen are aligned properly.
- Use a meter scale for precise measurement.

Data Analysis:

- Calculate the focal length for multiple positions.

4. Young's Double-Slit Experiment

Objective: To determine the wavelength of monochromatic light.

Setup:

- Use a monochromatic light source.
- Double slits illuminated by the source.
- Screen placed at a known distance.

Procedure:

- Measure fringe width (distance between bright fringes).
- Use the formula $\lambda = \frac{w \times D}{d}$, where:
 - w = fringe width,
 - D = distance from slits to screen,
 - d = distance between slits.

Tips:

- Ensure the slit width is narrow.
- Minimize ambient light.
- Take multiple readings for accuracy.

5. Determination of Acceleration Due to Gravity Using Simple Pendulum

Objective: To measure g using a simple pendulum.

Procedure:

- Measure the length L of the pendulum.
- Displace the pendulum through a small angle.
- Record the time for a fixed number of oscillations.
- Calculate the period T .

Calculation:

- Use $g = \frac{4\pi^2 L}{T^2}$.

Precautions:

- Use small angles (less than 15°).
- Measure time accurately using a stopwatch.
- Repeat readings for consistency.
