Question 1:

A 65-year-old patient in the ICU is receiving mechanical ventilation. The nurse notes decreased breath sounds on the right side. What is the most probable cause?

- A. Pulmonary embolism
- B. Pneumothorax
- C. Atelectasis
- D. Pneumonia

Answer: C. Atelectasis

Explanation: Decreased breath sounds on one side often indicate atelectasis, especially in ventilated patients. Pneumothorax could cause absent breath sounds but is usually associated with sudden chest pain and hypotension. Pulmonary embolism and pneumonia have different clinical presentations.

Question 2:

Which of the following interventions is most appropriate for a patient with increased intracranial pressure (ICP)?

- A. Elevate the head of the bed to 30 degrees
- B. Administer hypertonic saline
- C. Keep the patient in a supine position

- D. Perform vigorous coughing

Answer: A. Elevate the head of the bed to 30 degrees

Explanation: Elevating the head facilitates venous drainage from the brain, helping to reduce ICP. Hypertonic saline can be used but should be administered under medical supervision. Coughing increases ICP, so vigorous coughing is contraindicated.
